Introduction to SEO

SEO or Search Engine Optimization is defined as the **process of improving (optimising) the visibility of a website/webpage on Search Engines**, such as Google, Bing, etc.

The higher your pages appear in search results, the greater the chance they are discovered and clicked on.

The primary goal of SEO is to drive organic (non-paid) traffic to a website by improving its relevance and authority in the eyes of search engines.

Example of SEO

Imagine you run a **bakery in Pune** that sells cakes.

Without SEO:

If someone searches on Google: *“Best cake shop in Pune”*

Your bakery website might appear on **page 5 or 6**, where almost nobody goes.

Result: Fewer people discover your shop online.

google.com/search?sca_esv=fc0fadca8d161a09&rlz=1C1SLLM_enIN1123IN1124&sxsrf=AE3TifODG5c2rO9ffsrPJEs9xaWIRExKRQ:1757505467297&q=best+cake+shop+in+pu...

With SEO:

You optimize your website by:

- Adding keywords like **“Best cake shop in Pune”**, **“birthday cakes Pune”** on your homepage and blog posts.
- Creating content like *“Top 10 birthday cake designs in Pune”*.
- Registering your bakery on **Google Maps** (Google Business Profile).
- Getting reviews from happy customers.

Now, when someone searches *“Best cake shop in Pune”*, your website appears in the **top 3 results**.

Result: Many people click on your website, order cakes online, or visit your shop.

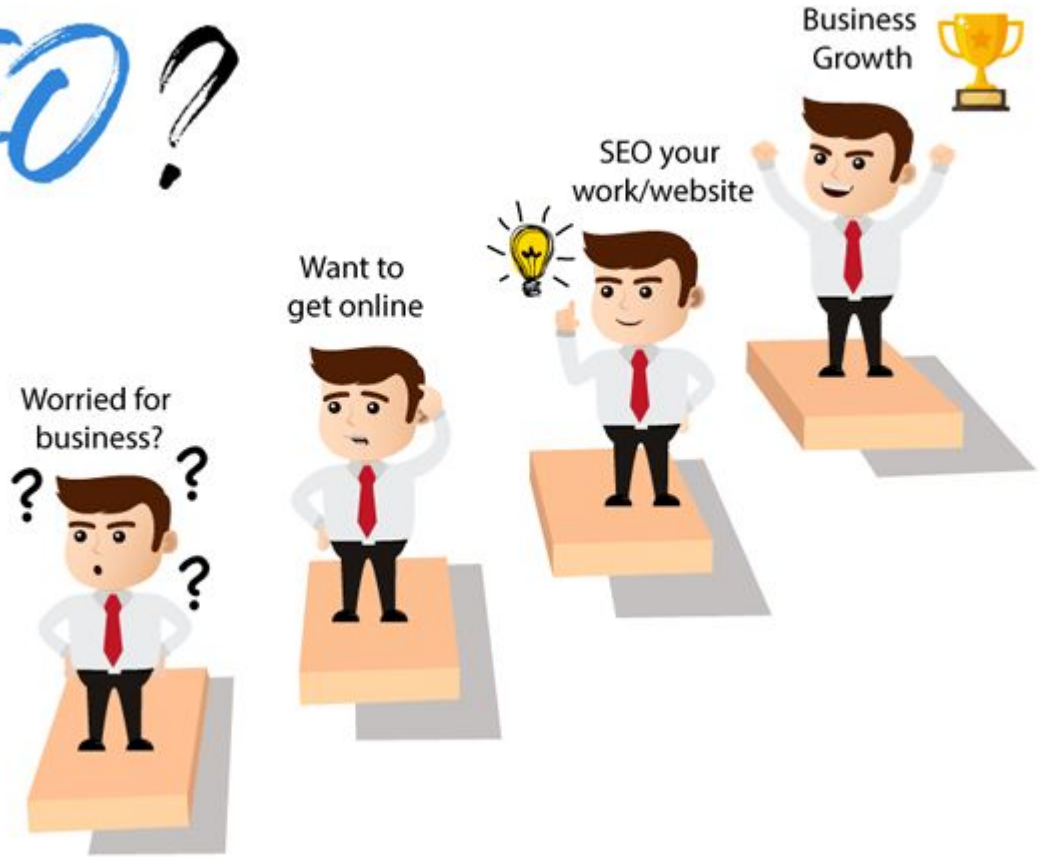
75% USERS **NEVER SCROLL** TO PAGE 2

70-80% Users **IGNORE THE PAID ADS**, Focus on **ORGANIC SEARCH RESULTS**

Why your business needs SEO?



IMPROVED QUALITY
Well-structured, Fast-loading, Useful Content
INCREASE WEB TRAFFIC
Higher Ranking, More Visitors
ANALYSIS & MONITORING
Track Performance, Find Improvements
SEO
BOOST VISIBILITY
Appear in Relevant Searchant Searches
COMPETITIVE ADVANTAGE
Outrank Competitors, First Choice
ENHANCED USER EXPERIENCE
Smooth, Fast, Readable

Why do we need SEO?

We need Search Engine Optimization for the following aspects:

- **To improve the quality of our website:** SEO ensures your website is well-structured, loads fast, and has useful content
- **To increase web traffic:**Higher ranking = more people visit your site.
- **To increase visibility:**SEO helps your site appear when people search for products/services you offer.
- **To enhance user experience:**Good SEO means smooth navigation, faster load time, and easy-to-read content.
- **To gain a competitive advantage**:If your site ranks higher than competitors, customers choose you first.
- **For analysis and monitoring of the website:** SEO tools help track performance and find improvements.

What are Search Engines?

Search engines are programs that allow users to search and retrieve information from the vast amount of content available on the internet. They use algorithms to index and rank web pages based on relevance to a user's query, providing a list of results for users to explore. Popular search engines include Google, Bing, and Yahoo.

- For example: a student wants to learn **Digital Marketing** so he searches the **"Digital Marketing tutorial Udemy"** in the search engine. So the student gets a list of links that contain the tutorial links of Udemy or we can say that a search engine is an internet-based software program whose main task is to collect a large amount of data or information about what is on the internet, then categorize the data or information and then help user to find the required information from the categorized information. Google, Yahoo, and Bing are the most popular Search Engines.

Bai du 百度

Ask

Yandex

YAHOO!

DuckDuckGo

ECOSIA

INTERNET ARCHIVE

Google : Commands over 90% of global search traffic and is the default choice in most countries.

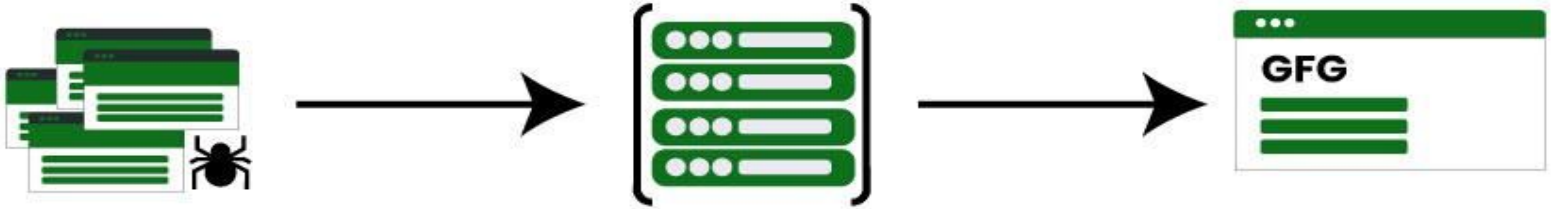
Baidu : Dominates in China with over 70% market share, primarily because Google is restricted there.

Yandex : Holds nearly 60% market share in Russia and offers search results tailored to Russian users.

Bing : Microsoft's search engine has about 3% global market share but is integrated into Windows and Office products.

DuckDuckGo : A privacy-focused search engine that doesn't track users, gaining popularity among privacy-conscious searchers.

How Search Engines Work?



Crawling

Google bots search the web for fresh material by crawling new pages.

Indexing

The Google Index is used to organise, categorise, and store the information that the bots have identi-fied.

Ranking

Which pages appear in the SERPs and in what order are determined by the Google Ranking algorithm.

Search engines are generally work on three parts that are

Crawling = Finding pages

Indexing = Storing & understanding pages

Ranking = Showing best results to users

1. **Crawling:** Search engines have a number of computer programs that are responsible for finding information that is publicly available on the internet. The crawler scans the web and creates a list of all available websites. Then they visit each website and by reading HTML code they try to understand the structure of the page, the type of the content, the meaning of the content, and when it was created or updated. Why crawling is important? Your first concern when optimizing your website for search engines is to make sure that they can access it correctly. If crawler cannot find your content you won't get any ranking or search engine traffic.

2. Indexing: Information identified by the crawler needs to be **organized, Sorted, and Stored** so that it can be **processed later by the ranking algorithm**. Search engines don't store all the information in your index, but they keep things like the **Title and description of the page**, **The type of content, Associated keywords Number of incoming and outgoing links**, and a lot of other parameters that are needed by the ranking algorithm. Why indexing is important? Because if your website is not in their index it will not appear for any searches this also means that if you have any pages indexed you have more chances of appearing in the search results for a related query.

Ranking: Ranking is the position by which your website is listed in any Search Engine. There is following three steps in which how ranking works .

Step 1: Analyze user query

Step 2: Finding matching pages

Step 3: Present the results to the users -

Step 1: Analyze user query -

This step is to understand what kind of information the user is looking for. To do that analyze the user's query by breaking it down into a number of meaningful keywords. A keyword is a word that has a specific meaning and purpose, for example when you type how to make a chocolate cupcake search engines know that you are looking for specific information so the results will contain recipes and step-by-step instructions.

They can also understand the meaning of how to change a light bulb is the same as how to replace a light bulb search engines are clever enough to interpret spelling mistakes also.

Step 2: Finding matching pages -

This step is to look into their index and find the best matching pages, for example, if you search dark wallpaper then it gives you the result of images, not text.

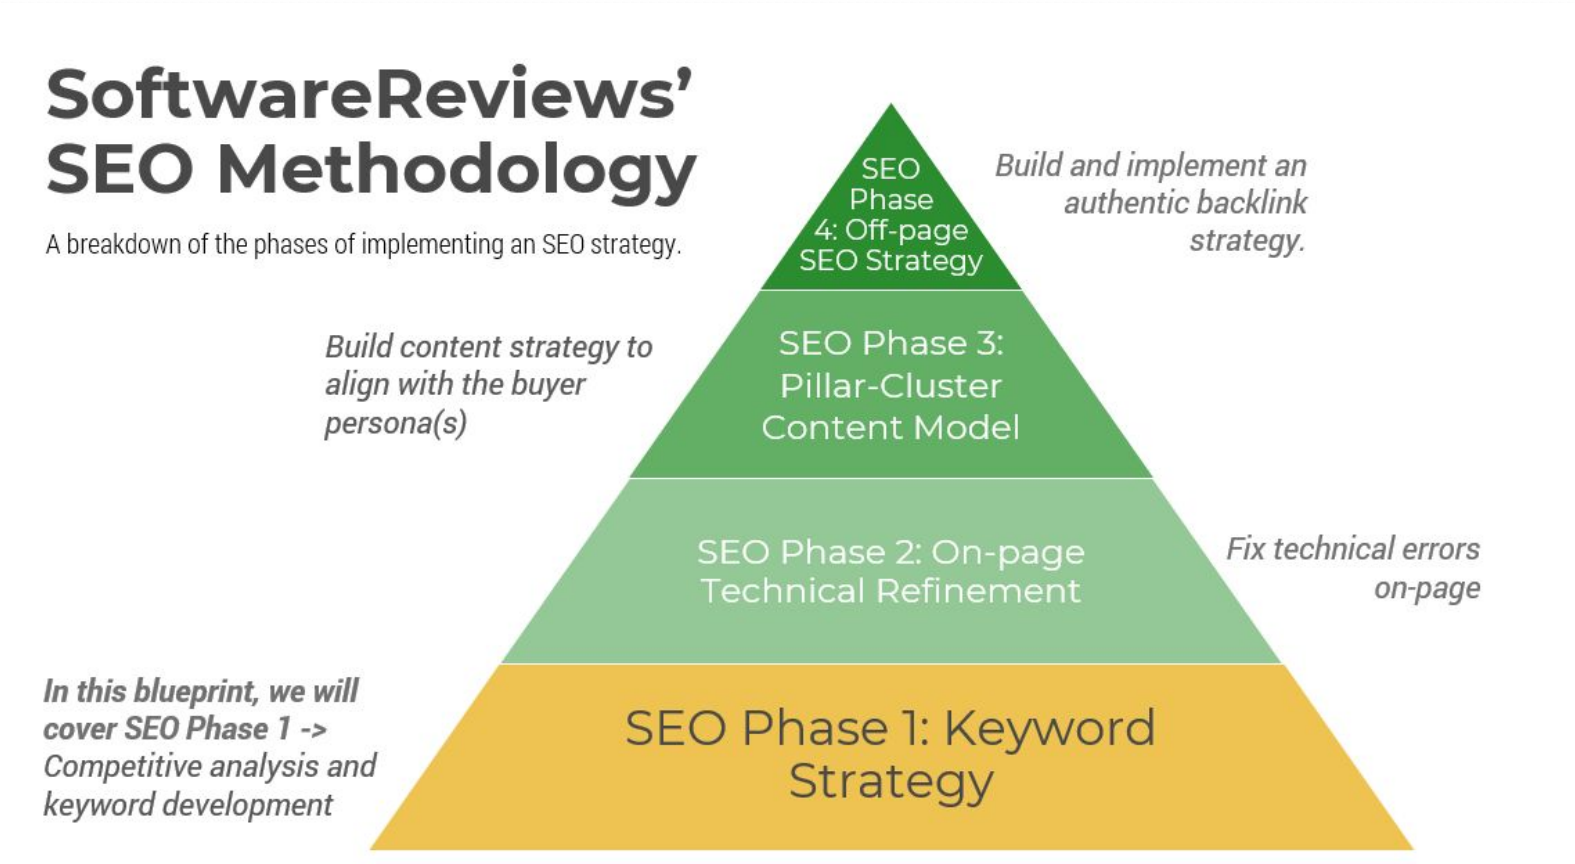
Step 3: Present the results to the users -

A typical search results page includes ten organic results in most cases it is enriched with other elements like paid Ads, direct answers for specific queries, etc.

How to get your website in Google?

1. Google constantly crawls the web and indexes websites.
2. Google crawlers visit websites in its index, links on those sites to discover other pages. It takes note of new websites, changes to existing websites and dead links. Google does not index all of the web. Low-quality sites and harmful sites are weeded out or ignored.
3. Based on its assessment, Google determines which websites to crawl, how often and how many pages to fetch. If you have a good website and it's linked to by other websites, Google will discover your site sooner or later.
4. In fact, the vast majority of websites listed in Google results are added automatically. When you have just created a website or blog, you can speed up the process of getting listed by Google. Simply, bring your website to the attention

SEO Phases



SoftwareReviews' SEO Methodology
A breakdown of the phases of implementing an SEO strategy.
SEO Phase 4: Off-page SEO Strategy
Build and implement an authentic backlink strategy.
SEO Phase 3: Pillar-Cluster Content Model
Build content strategy to align with the buyer persona(s)
SEO Phase 2: On-page Technical Refinement
Fix technical errors on-page
SEO Phase 1: Keyword Strategy
In this blueprint, we will cover SEO Phase 1 -> Competitive analysis and keyword development

1. SEO Phase 1: Keyword Strategy

This is the foundation of the pyramid and the first step. It focuses on **competitive analysis and keyword development**. You identify what people are searching for and what your competitors are ranking for.

Example: A software company wants to rank for project management software. In this phase, they would research keywords like "best project management tools," "Agile project management," and "project management software for small business." They'd also analyze top-ranking competitors to see which keywords they target and how.

2. SEO Phase 2: On-page Technical Refinement

This phase, the second layer, is about **fixing on-page technical errors**. After defining your keywords, you ensure your website can be easily crawled and understood by search engines.

Example: The software company from Phase 1 finds that their website loads slowly and isn't mobile-friendly. They fix these technical issues, optimize image sizes, and ensure their site structure is logical. They also add their target keywords to page titles, headings, and meta descriptions.

3. SEO Phase 3: Pillar-Cluster Content Model

This is the third layer of the pyramid. It's about building a **content strategy that aligns with your buyer persona**. The diagram recommends using a "Pillar-Cluster Model," where you create a broad, central "pillar" page and link to more specific "cluster" pages. This establishes your site as an authority on a topic.

Example: For the project management software company, the pillar page could be a comprehensive guide titled "The Ultimate Guide to Project Management." They would then create separate cluster pages on more specific topics like "Top 5 Agile Methodologies," "How to Choose Project Management Software," and "Project Management for Beginners." Each cluster page links back to the main pillar, strengthening its authority.

4. SEO Phase 4: Off-page SEO Strategy

The final, top layer of the pyramid, this phase focuses on **building and implementing an authentic backlink strategy**. Backlinks are links from other websites to yours; they act as a vote of confidence, signaling to search engines that your site is trustworthy and authoritative.

Example: The software company would reach out to reputable industry blogs and publications to get their content featured. They might offer a guest post, be included in an expert roundup, or be cited as a source in an article. These links from high-authority sites build their own site's credibility, leading to higher rankings.

History of Search Engine

The Early Days: The "Wild West" (1990s)

The Birth of Search: In the early 1990s, the internet was a small, unorganized place. As more websites were created, the need for a way to find information led to the first search engines like AltaVista, Lycos, and Yahoo!.

Simple Algorithms: Early search engines were primitive. They primarily relied on keywords to rank pages. Webmasters would submit their sites to directories and use meta keyword tags to tell search engines what their pages were about.

Manipulation & "Black Hat" Tactics: SEO was born out of the desire to rank higher. Since algorithms were simple, people quickly figured out how to manipulate them. Common "black hat" tactics included:

- **Keyword Stuffing:** Repeating a keyword dozens or even hundreds of times on a page to trick the search engine into thinking it was highly relevant.
- **Hidden Text:** Placing keywords in tiny or white-colored text on a white background, making them invisible to users but visible to search engine crawlers.

The Google Era and the Rise of Backlinks (Late 1990s - Early 2000s)

PageRank and the Link Revolution: In 1998, two Stanford students, Larry Page and Sergey Brin, launched Google. Their revolutionary PageRank algorithm changed everything. Instead of just keywords, it measured a website's authority based on the quality and quantity of links pointing to it. A link was seen as a "vote" for a page's importance.

The Focus Shifts to Backlinks: This created a new kind of "black hat" manipulation. People started building "link farms" and buying links to artificially inflate their PageRank. The SEO industry grew rapidly, focused on building as many links as possible, regardless of their quality.

The Age of Algorithms and Penalties (2010s)

Combating Spam: Google began a series of major algorithm updates to combat low-quality content and spammy link-building practices.

- **Panda (2011):** This update targeted "thin" or low-quality content, penalizing websites that were filled with poorly written, duplicate, or unoriginal content.
- **Penguin (2012):** This update went after websites with spammy or manipulative link profiles, targeting those who had bought links or engaged in other deceptive backlink schemes.
- **Hummingbird (2013):** This was a major shift. Instead of just looking for keywords, Hummingbird focused on **semantic search** and user intent. It allowed Google to understand the context and meaning of a user's query, even if the exact keywords weren't used. This marked a move away from keyword-based SEO and towards topic-based, quality content.

The User-Centric and Mobile-First Era (Mid-2010s - Present)

Mobilegeddon (2015): With the rise of smartphones, Google made mobile-friendliness a major ranking factor. Websites that were not optimized for mobile devices saw a drop in their rankings.

E-A-T & E-E-A-T: Google began to emphasize **E-A-T (Expertise, Authoritativeness, and Trustworthiness)** as a key quality signal. This was especially important for "Your Money, Your Life" (YMYL) topics like health and finance. In 2022, this was updated to **E-E-A-T**, adding "Experience" to the equation, stressing the importance of firsthand experience with a topic.

Introduced by Google's Search Quality Evaluator Guidelines, it became important around 2014 and was emphasized especially for **YMYL (Your Money or Your Life)** topics **(health, finance, legal, safety, etc.).**

Expertise → Is the content created by someone with deep knowledge or skill in the subject?

Authoritativeness → Is the author, site, or brand recognized as a reliable source in that field?

Trustworthiness → Can the content and website be trusted (accuracy, transparency, security)?

E-E-A-T (Experience, Expertise, Authoritativeness, Trustworthiness)

In December 2022, Google updated the model by adding Experience.

Experience → Does the creator have firsthand or life experience with the topic?

Example: A travel blog written by someone who actually visited the location.

Example: A product review written by someone who has used the product.

So now it's:

Experience → Expertise → Authoritativeness → Trustworthiness

AI and Voice Search: With the rise of voice assistants (Siri, Alexa, Google Assistant), SEO began to adapt to conversational search queries. Google's use of AI, like BERT and RankBrain, has made the search engine incredibly good at understanding the nuances of natural language.

The Future of SEO

Today, SEO is no longer about tricking search engines. It's about providing the best possible experience for the user. A successful modern SEO strategy involves:

High-Quality, In-Depth Content: Content that truly answers a user's question and demonstrates expertise.

Excellent User Experience (UX): A fast, easy-to-navigate, and mobile-friendly website.

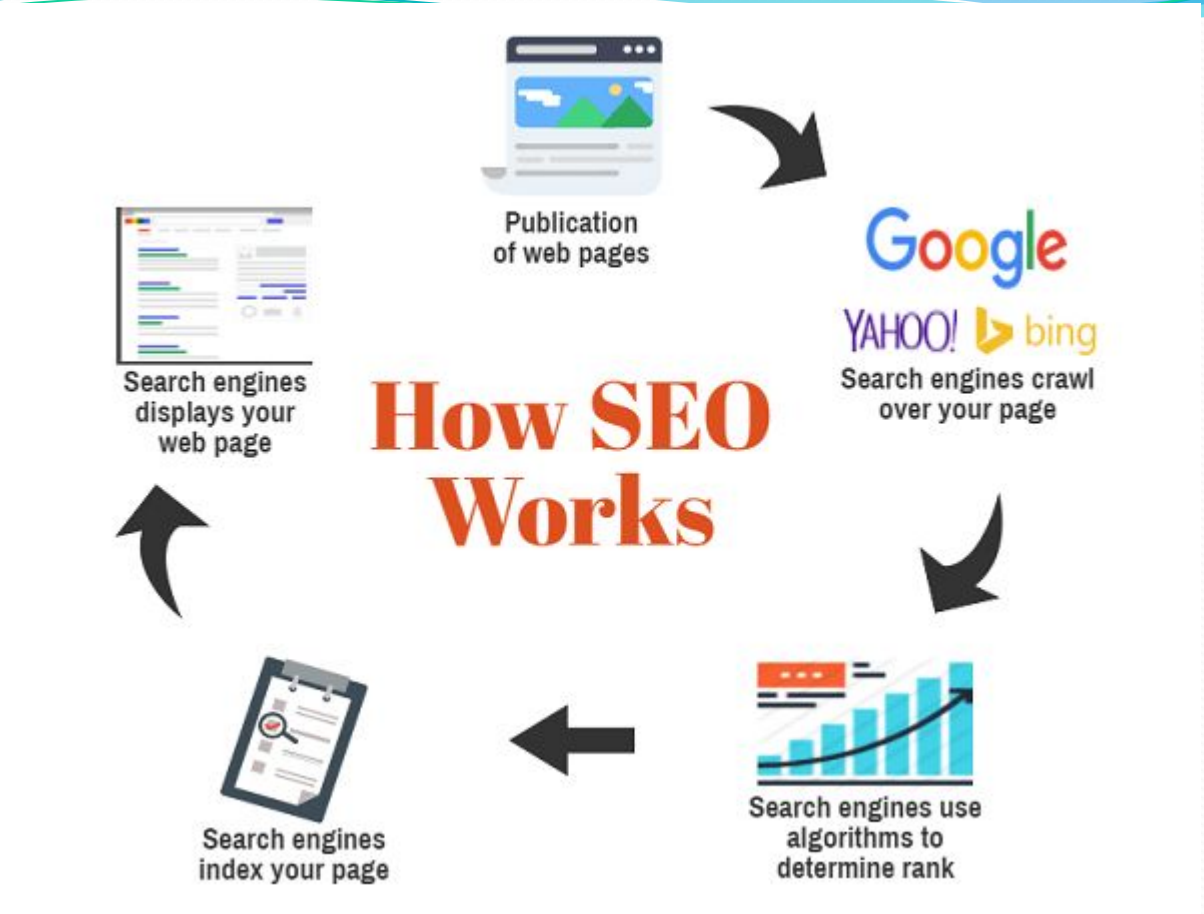
Technical SEO: A clean, crawlable site structure.

Authentic Link Building: Earning links from authoritative and relevant websites through creating great content that others want to cite.

Optimizing for AI: With the rise of AI-driven search experiences like Google's SGE (Search Generative Experience), SEO is evolving once again to focus on getting your content into the most prominent AI-generated summaries.

How Search Engines Work & How How SEO Influences Them

The Journey from Search to Discovery



How SEO Works
Publication of web pages
Google
YAHOO!
bing
Search engines crawl over your page
Search engines use algorithms to determine rank
Search engines index your page
Search engines displays your web page

1. Publication of Web Pages

This is the starting point of the cycle. It's when you create a new blog post, a product page, a service page, or any other content and publish it on your website. This step is entirely within your control. You choose the topic, write the content, and design the page.

2. Search Engines Crawl Over Your Page

Once your page is live, search engines (like Google, Yahoo!, and Bing, as shown in the diagram) send out automated programs called **crawlers** or **spiders**. These crawlers visit your website by following links from other sites or from your own internal links. Their job is to read and understand the content on your page. This is where your first SEO efforts pay off—if your site is technically sound and easy to navigate, crawlers can find and access your page easily.

3. Search Engines Index Your Page

After the crawlers have analyzed your page, they send that information back to the search engine's central database, known as the **index**. The index is a massive digital library that stores a copy of every web page the search engine has ever found. When your page is indexed, it becomes eligible to appear in search results. Your SEO efforts in this phase are crucial to ensure your page is correctly cataloged based on its content, keywords, and other signals.

4. Search Engines Use Algorithms to Determine Rank

This is the most complex part of the process. When a user enters a search query, the search engine doesn't just display every page in its index. Instead, it uses a complex algorithm to decide which pages are the most relevant and authoritative for that specific query. This is where SEO truly matters. The algorithm considers hundreds of factors, including:

The relevance of your content to the search query.

The quality and originality of your content.

The user experience on your page (e.g., page speed, mobile-friendliness).

The authority of your website (based on backlinks from other sites).

User signals (e.g., click-through rate, time spent on page).

The better your page aligns with these ranking factors, the higher it will appear in the search results.

5. Search Engines Display Your Web Page

Finally, the cycle concludes when your page is displayed in the Search Engine Results Page (SERP). If your SEO efforts have been successful, your page will rank prominently, leading to increased visibility and traffic.

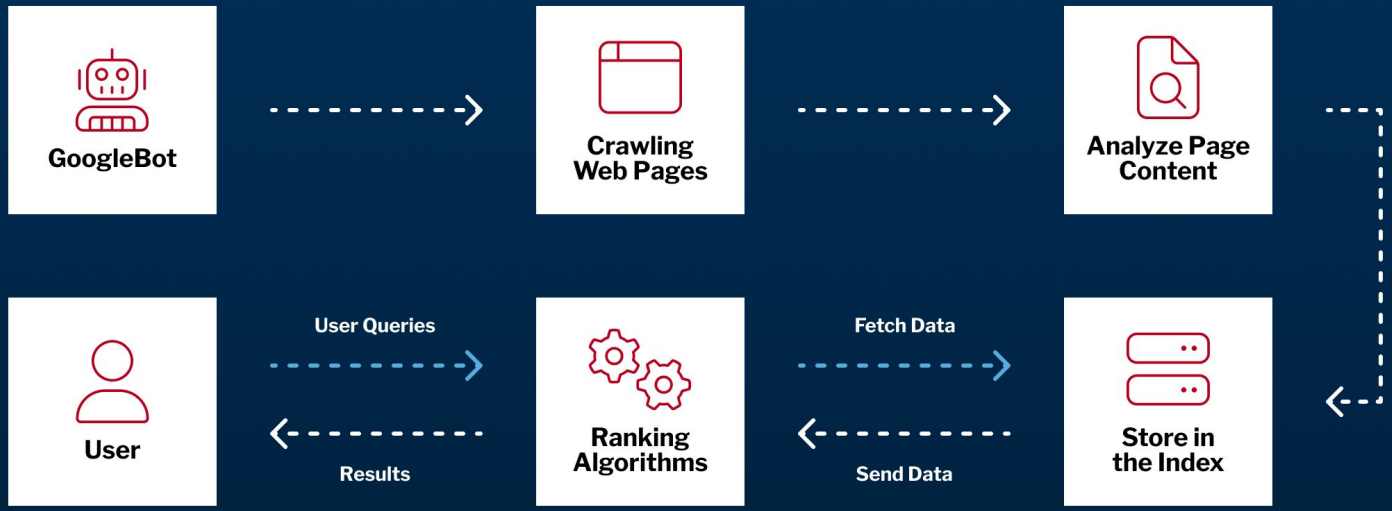
Googlebot(Google Crawler)

Googlebot is the generic name for the web crawlers used by Google Search to discover, crawl, and index websites for search engine results. It functions as an automated program, or "bot," that browses the internet in a manner similar to a web browser.

How the Google Crawler Works

The Googlebot crawler is a tool used by Google to discover and index web pages across the internet. It systematically scans websites, following links from one page to another, and gathers information about the content on each page. This information is then stored in Google’s index, making it accessible for search queries.

How Does the GoogleBot Crawler Work?



americaneagle.com.

Googlebot Types and Functionality

Googlebots are crucial for SEO as they "read" web pages and index them so they can be served to searchers in response to their queries. There are several types of Googlebots, each with its specific functionality.

Mobile Crawler

The purpose of the Mobile Crawler is, well, what you'd think! It specifically targets mobile-friendly content to ensure that Google provides relevant and useful search results for users accessing the web through mobile devices. It's a reflection of the growing usage of mobile devices for internet access.

Desktop Crawler

The Desktop Crawler is designed to simulate the view of a traditional desktop web browser. This enables Googlebot to understand and index web pages in a way similar to how a desktop user would experience them, ensuring that content and layout optimized for larger screens are properly indexed.

Specialized Crawlers

Googlebot uses Specialized Crawlers to gather information from specific types of websites and content. From news articles to images, videos, and local business listings, these crawlers are designed to dive deep into every niche. By leveraging the power of specialized crawlers, Google enhances its understanding and indexing of the internet, with the goal to deliver higher-quality and more relevant search results for you.

News Crawler

One specialized crawler targets and indexes content from news websites, focusing on articles and current events. This one is aptly named the “News Crawler” and it helps in populating and updating Google News with the latest information.

Images Crawler

Crawling the depths of the internet, the Images Crawler uncovers and organizes captivating images for Google's search engine. With its sole purpose of locating and categorizing pictures based on their relevance and exceptional quality, it ensures that only the best visuals make it into the search results, improving Google Image Search.

Video Crawler

Video crawlers are specialized bots that scour the internet for video content. They extract all the important details like titles, descriptions, and tags from videos. This means Google can present you with truly relevant, comprehensive, and high-quality videos when you search.

Types of SEO techniques

SEO techniques can be categorized in multiple ways, most commonly by their ethical approach **(white, gray, Gray hat SEO ,or black hat SEO)** and by their focus area **(on-page, off-page, and technical SEO, Local SEO).** Understanding these categories is essential for developing a comprehensive and effective strategy.

By ethical approach

1. White hat SEO

White hat SEO refers to ethical and legitimate optimization strategies that adhere to search engine guidelines to improve a website's visibility over the long term.

Create high-quality content: Produce unique, relevant, and valuable content that is helpful to your audience.

Improve user experience: Optimize your website's navigation, mobile-friendliness, and page speed to create a better experience for visitors. This is often measured by metrics like Core Web Vitals.

Earn authoritative backlinks: Acquire links from other credible websites through genuine methods like guest posting or creating content that others naturally want to reference.

Use proper keyword research: Strategically and naturally incorporate relevant keywords in titles, headings, and content to align with user intent.

2.Black hat SEO

Black hat SEO techniques exploit and violate search engine guidelines to achieve quick, but often short-lived, ranking improvements. These practices carry a high risk of penalties, including being removed from search results entirely.

Keyword stuffing: Crams an excessive number of keywords into content in an unnatural way to manipulate rankings.

Cloaking: Displays different content to search engine crawlers than what is shown to a user.

Link schemes: Buys or trades links to artificially inflate a site's authority.

Hidden text or links: Hides keywords or links from human users by making them the same color as the background, for example.

Doorway pages: Creates low-quality pages optimized for specific keywords that redirect users to another page.

3. Gray hat SEO

Gray hat SEO involves techniques that exist in a "gray area" between white and black hat SEO. These strategies are not explicitly forbidden but push the boundaries of search engine guidelines and carry some risk of penalties.

Buying expired domains: Acquires expired domains with high authority to use their existing link profile to boost a new site.

Paid reviews: Pays for positive customer reviews, which is unethical and against the guidelines of most review platforms and search engines.

Excessive link exchanges: Engages in reciprocal link exchanges, which can be flagged by search engines if done excessively to manipulate rankings.

Content spinning: Uses software to rewrite existing content to make it appear unique, which often results in low-quality, unnatural-sounding text.

By focus area

1. On-page SEO

This involves optimizing elements on your actual website to help search engines understand your content and improve your ranking.

Content optimization: Creates high-quality content that satisfies user search intent and uses relevant keywords naturally.

Metadata optimization: Writes compelling meta titles and descriptions to encourage higher click-through rates from search results.

URL structure: Uses clean, readable, and keyword-rich URLs.

Internal linking: Links to other relevant pages on your website to improve site navigation and help search engines crawl your content.

Image optimization: Uses descriptive file names and alt text for images.

2. Off-page SEO

This refers to activities that take place outside of your website to increase its authority and trustworthiness.

Link building: Secures high-quality backlinks from other reputable, relevant websites.

Brand building: Actively manages brand mentions, social media presence, and online reviews.

Guest posting: Writes articles for other websites in your industry to earn a link back to your site.

Social media marketing: Engages with your audience on social platforms to increase brand visibility and drive traffic.

3. Technical SEO

Technical SEO focuses on a website's backend and infrastructure to help search engine crawlers more effectively crawl, index, and render the site.

Page speed: Optimizes load times for a better user experience, which is a key ranking factor.

Mobile-friendliness: Ensures the website is responsive and functional on all mobile devices.

XML sitemaps: Provides a roadmap for search engines to discover all important pages on your site.

Structured data (Schema Markup): Adds code to your website to help search engines understand your content and display richer results.

Site architecture: Creates a logical and well-organized site structure for easy navigation.

4. Local SEO

Local SEO is a specialized approach for businesses that serve a specific geographic area, aiming to appear in local search results.

Google Business Profile optimization: Creates and manages a Google Business Profile with accurate business information (Name, Address, Phone number or "NAP").

Local citations: Lists your business in online directories and on other platforms with consistent NAP data.

Online reviews: Encourages customers to leave reviews on Google and other sites.

Localized content: Creates content that targets area-specific queries.

Keyword Planner Tool

This tool is a key resource for digital marketers and content creators to discover, analyze, and research keywords for their online campaigns and strategies. It's most commonly associated with **Google Ads**, where it helps advertisers find relevant keywords to target for their search campaigns.

How Google Keyword Planner Works

Keyword Ideas

Keyword Ideas

Negative Keywords

Start with a Seed Keyword or Website URL

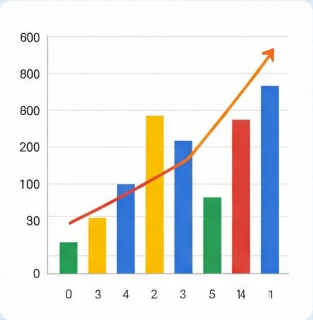
Discover New Keywords

Get Search Volume & Forecasts

Analyze Keyword & Bid Estimates

Bids

Get Search Volume & Forecasts



Analyze Compeiition & Bid Estimates

Keyword	Avg. Seurches	Compeiition (Low, Medium, High)	Top of page bid (high range)
1	240	1200%	198%
1	230	1210%	190%
2	230	1220%	190%
2	340	310%	1289
3	310	190%	160%
2	495	180%	1585
2	220	180%	0251

The Keyword Planner tool primarily functions in two ways:

1) Discovering New Keywords

You can enter a few words, a phrase, or even a URL related to your product or service. The tool then generates a list of new keyword ideas that are relevant to your business. This helps you find keywords you may not have thought of and expand your reach. For example, if you sell "handcrafted leather bags," the tool might suggest "artisanal leather handbags," "designer satchels," or "custom leather totes."

2) Getting Search Volume and Forecasts

Once you have a list of keywords, you can use the tool to get valuable data on them. This includes:

Average monthly searches: This shows how many times a keyword is searched for each month, giving you an idea of its popularity.

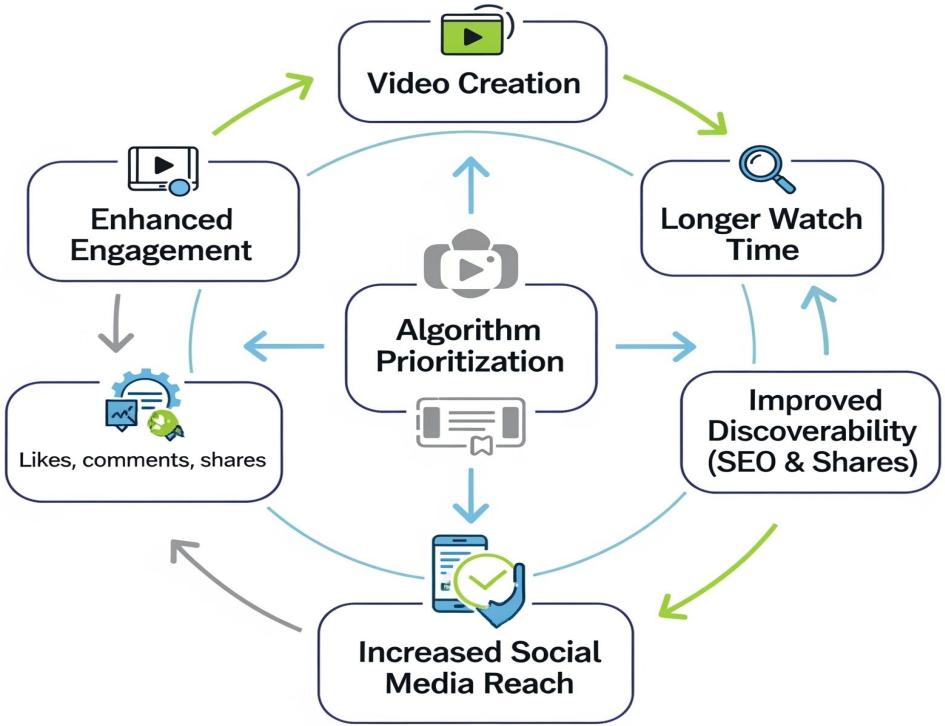
Competition level: This indicates how many advertisers are bidding on a particular keyword, categorized as low, medium, or high. Higher competition usually means a higher cost-per-click (CPC).

Bid estimates: The tool provides an estimated cost range for what you might pay per click to be on the first page of search results for that keyword.

The Keyword Planner tool is essential for several reasons:

1. **Informed Decisions:** It allows you to make data-driven decisions about which keywords to target, ensuring your marketing efforts are focused on terms with a good balance of search volume and competition.
2. **Budgeting:** By providing bid estimates, it helps you forecast your ad spend and manage your advertising budget more effectively.
3. **Content Strategy:** Beyond just advertising, the data from the Keyword Planner can inform your overall content strategy. You can create blog posts, articles, and landing pages based on what people are actually searching for, which can help improve your search engine optimization (SEO) and organic traffic.

Social media reach-video creation and submission



Video Creation: The process begins with the creation of a video. This can be any type of video content designed for social media.

Enhanced Engagement: When a video is uploaded, it has a high potential for engagement. Users are more likely to interact with video content by giving **likes**, leaving **comments**, and, most importantly, **sharing** it with others. This high engagement signals to the platform's algorithm that the content is valuable.

Longer Watch Time: Videos that are engaging and well-produced also tend to hold a viewer's attention for a longer duration. This metric, known as **watch time**, is a key indicator for social media platforms to determine the quality of the content.

Algorithm Prioritization: Both enhanced engagement and longer watch time feed into the central hub of the diagram: **Algorithm Prioritization**. The platform's algorithm recognizes that this video is popular and high-quality, and it decides to promote it. The algorithm will show the video to more users who are likely to be interested, pushing it higher in their feeds or suggesting it as recommended content.

Increased Social Media Reach: The final outcome is a significant increase in social media reach. Your video is now being viewed by a much larger audience, including people who don't already follow you. This increased reach then cycles back to encourage more **Video Creation**, as you have a larger audience to create content for, starting the positive loop all over again.

Improved Discoverability (SEO & Shares): The algorithm's prioritization of the video leads to improved discoverability. The video is seen by a much wider audience. This is also compounded by users sharing the video with their networks, which further expands its reach. Keywords used in the video's title and description also help with Search Engine Optimization (SEO), making the video easier to find.

Why Does SEO Maintenance Matter?

- Changing Search Engine Algorithms
- Your Competitors Are Doing SEO Maintenance Too
- Reviewing If Your Current Approach Works
- Search Engines Don't Like a Stale Website

9 Benefits of SEO Maintenance

- Better User Experience
- Brings Higher Close Rates
- Results Higher Conversion Rate
- Promotes Better Cost Management
- Builds Brand Credibility
- Helps Establish Brand Awareness
- Long-Term Marketing Strategy
- Improves Website Speed
- Takes You Ahead of the Competition

Better User Experience

People have a low attention span and are always on the lookout for innovative, engaging content that is to the point. While your digital marketing might include different media formats on your site it is crucial to ensure these formats are supported to run smoothly on your website.

Brings Higher Close Rates

Reaching out directly to consumers through digital marketing outreach methods has shown lower close rates compared to the traffic brought in through SEO practices. By ensuring your SEO maintenance is on point, you drive in traffic that is directed to your website by the results displayed to match the user's search intent. The quality of these leads is much higher with statistics showing 12.9% more close rates than outreach efforts without SEO.

Results in Higher Conversion Rate

Consistently maintaining high rankings and showing up on the top positions of the first page of search results increase the domain authority of your website. This helps increase the credibility of your site, driving in more quality traffic resulting in higher conversion rates.

Promotes Better Cost Management

Consistent maintenance of the SEO strategy allows you to drive more quality traffic to your site, and increase lead generation at a higher rate than through outreach campaigns, which cost more. Higher authority websites also naturally rank higher and do not have to invest in pay per click or other paid tools to advertise their page.

Builds Brand Credibility

The longer the website of your business ranks high, both Google and consumers view your site as a credible source to access that can offer better services than lower-ranking competitors. This is why it is important to practice consistent ongoing SEO maintenance on a regular basis to ensure you are maximizing your efforts towards increasing or maintaining your ranks at the least.

Helps Establish Brand Awareness

SEO ensures that your business' website is found out through organic search. A higher ranking website is always more easily shown and accessible to users which leads to more people in the industry being aware of your brand's existence- whether competitor, consumer or someone looking for content on your business!

Long-Term Marketing Strategy

Building a high SEO ranking site takes time, from upto at least 4-6 months. Fortunately, it takes as much as time for your website to be taken lower than its optimal ranking so a secure SEO plan is a long-term marketing strategy.

Improves Website Speed

Positive user online experiences begin with the speed of navigation and the time it takes to load website content. Optimizing the elements of your website helps Google see your website as a better fit to show on the organic search results that a competitor website offering similar content with lower website speed. This lowers the bounce rate of your site and increase opportunities for lead generation.

Takes You Ahead of the Competition

One of the most important benefits of SEO is that as you rank higher, you are beating the competition. Your business is viewed as a more credible, reliable and authoritative company in the industry to both Google and consumers.

Google
SEARCH ENGINE

Google search engine

Google Search is a widely used search engine that allows users to find information online using keywords or phrases. It is operated by Google. Automated software called web crawlers find and index billions of web pages.

How Google Search work

The search process involves three main stages:

Crawling: Web crawlers, also known as "Googlebot," search the web for new and updated pages. They download content such as text, images, and videos.

Indexing: The content from crawled pages is analyzed and stored in Google's database, the index. During this stage, information like the page's content, location, and usability are analyzed.

Serving search results: When a user enters a query, algorithms retrieve the most relevant, useful, and authoritative information from the index. The results are presented in a ranked order.

Key ranking factors

Algorithms consider factors to determine which pages are most relevant:

Query meaning: The algorithm analyzes the user's search query to understand the intent.

Relevance: Keywords from the query are matched to content on the indexed pages.

Quality: The authority and trustworthiness of the content are evaluated. Backlinks are one signal of quality, when other credible websites link to a page.

Usability: The search engine assesses the user experience, including page speed and mobile-friendliness.

Context: A user's location, search settings, and search history can also influence the results.

Features and history

Monopoly: Google holds a large market share in the search engine market. It has faced recent legal challenges regarding its market dominance.

Origin: The search engine began as a research project at Stanford University in 1996 under the name "BackRub" by co-founders Larry Page and Sergey Brin. The company was incorporated, and Google Search launched in 1998.

Advertisements: Text-based ads associated with search keywords were sold early on. These ads appear alongside search results and generate the majority of the company's revenue.

AI development: Google has accelerated its AI integration within Search, including the release of its Gemini AI models
