```python
class TextEditor:
    def __init__(self):
        self.document = ""
        self.undo_stack = []
        self.redo_stack = []

    def make_change(self, new_text):
        self.undo_stack.append(self.document)
        self.document = new_text
        self.redo_stack.clear()
        print("Change made.")

    def undo_action(self):
        if not self.undo_stack:
            print("Nothing to undo.")
            return
        self.redo_stack.append(self.document)
        self.document = self.undo_stack.pop()
        print("Undo performed.")

    def redo_action(self):
        if not self.redo_stack:
            print("Nothing to redo.")
            return
        self.undo_stack.append(self.document)
        self.document = self.redo_stack.pop()
        print("Redo performed.")

    def display_document(self):
        print("Current Document State:", self.document)
```

Output:

```
Change made: Hello
Change made: Hello World
Change made: Hello World!!!
Document state: "Hello World!!!

  --- Performing Undo
Undo performed. Current state: "Hello World
Undo performed. Current state: "Hello

  --- Performing Redo
Redo performed. Current state: "Hello World
Document state: "Hello World
```
